

Operability & integrity monitor

Live-style playback of a generic drilling-riser scenario: telemetry and metocean drive the operability margin, the flex-joint response (physics plus a measured-tracking correction), a wellhead bending-moment indicator, and the drift-off time-to-limit — every value pre-computed by the analytical seams and played back (the page does no physics).

WHAT YOU GET

- Watch-circle, operability margin, flex-joint, wellhead moment and drift-off at a glance
- Twin-B correction only tightens the verdict; limits stay cited code values
- Screening tier — operability and drift-off escalate states shown separately

Ask Deckhand: “Monitor my drilling-riser operability and integrity from a telemetry track: show the operability margin, the flex-joint response with the measured-tracking correction, a wellhead bending-moment indicator, and the drift-off time-to-limit if thrusters were lost now.” — send to `@the_deckhand_bot` to run it live.
