

DNV-RP-B401

Cathodic-protection anode explorer

DNV-RP-B401 sacrificial-anode design for a jacket or monopile — structure and seawater-climate selectors and a design-life slider drive total anode mass by external-coating quality. Every value is a live marine_structure_current_demand run (current demand → anode mass → anode count).

31.7 → 18.6 t

bare vs premium coating

159 → 93

anode count

WHAT YOU GET

- Current demand with coating breakdown → anode mass → anode count, per DNV-RP-B401
- Coating quality (bare / aged / good / premium) swept against a 10–40 yr design life and seawater climate
- Premium external coating cuts a 4-leg jacket's 25-yr anode mass from ~31.7 t (159 anodes) to ~18.6 t (93)
