

MIL-STD-889 · Oddo–Tomson (SPE 21710)

Corrosion & production chemistry

Screening-level materials-compatibility and produced-water scaling checks that sit alongside the integrity workflow — dissimilar-metal galvanic risk on the published anodic-index method, and mineral-scale saturation tendency in the Oddo–Tomson conditional-solubility framework. Both run from public constants with every coefficient documented and overridable; parameterized for calibration before quantitative use.

constant basis

WHAT YOU GET

- Galvanic couple screen (OK / marginal / protect) vs per-environment allowable ΔV , MIL-STD-889 anodic index
- Mineral-scale saturation indices (calcite / sulfate / halite) with bottomhole → wellhead trending
- Formation-water × seawater mixing sweeps for waterflood compatibility
- Published anodic-index and thermodynamic constants only; no operator-proprietary data
